

NN Subscriber VIP Login and Token Project

Overview: This project allows NN subscribers to login to a special area under NN, “VIP.naturalnews.com” and there, they can access special content and special tools.

Monthly tokens credit

Each month, every NN subscriber receives 25,000 tokens. These are just called NaturalNews subscriber VIP tokens. These tokens are assigned to them on the 1st day of the month. The tokens expire on the 1st day of the next month and are replaced with a new total of 25,000 tokens. Using certain tools will consume tokens. The tokens do NOT roll over to the next month. They expire.

LOGIN PROCEDURE:

Importantly, there is NO PASSWORD. To login, a user enters their email address. An email is sent to them with a large font 6-digit code like 123456. They must then enter this 6-digit code on the screen. This will give them access and should set a cookie for 90 days.

Importantly, in order to avoid significant spammers here, we either need to put a strong captcha at the login (where they enter their email address), or we need to log originating IP and block same IP from trying too many times. Probably easiest to put a strong captcha.

When a subscriber logs in, they should prominently see “You have X tokens remaining this month” (large bold font). And near that, “You can use tokens to query Enoch, see below.”

VIP content:

A VIP home page will have large thumbnails that are clickable, representing the VIP content and tools they get to access:

VIP ITEM #1: A collection of Animated video book reports. This will be a collection of Brighteon.com videos, that are clickable to play them. It should show all the videos in a grid format, similar to thumbnails on Brighteon.

VIP ITEM#2: Access to the Enoch LLM (7B). This will allow users to access a chat window of the Enoch 7B LLM, and they can use it to carry out inference. During inference, each token of inference (both the input and output tokens) uses up 1 token of the user. So a query that uses 1000 tokens would deduct 1000 tokens from their total token amount. When they click on this, they should be taken to enoch.consumerwellness.org where they can use Enoch.

VIP ITEM#3: An ingredients checker that uses Enoch LLM. This allows a user to enter a list of ingredients in a text box. With a proper prompt, the LLM returns an analysis of the ingredients and whether they are good or bad. This function uses tokens, based on the token count of the output.

Additional VIP items will be added. Some will use tokens.
